COPYRIGHT (C) 2001 AMERICAN CHEMICAL SOCIETY (ACS)

Copyright of the articles to which records in this database refer is held by the publishers listed in the PUBLISHER (PB) field (available for records published or updated in Chemical Abstracts after December 26, 1996), unless otherwise indicated in the original publications.

This file contains CAS Registry Numbers for easy and accurate substance identification.

This file supports REGISTRY for direct browsing and searching of all substance data from the REGISTRY file. Enter HELP FIRST for more information.

CAPLUS now provides online access to patents and literature covered in CA from 1947 to the present. On April 22, 2001, bibliographic information and abstracts were added for over 2.2 million references published in CA from 1947 to 1966.

The CA Lexicon is now available in the Controlled Term (/CT) field. Enter HELP LEXICON for full details.

Attention, the CA Lexicon is the copyrighted intellectual property of the American Chemical Society and is provided to assist you in searching databases on STN. Any dissemination, distribution, copying, or storing of this information, without the prior written consent of CAS, is strictly prohibited.

YOU HAVE REQUESTED DATA FROM FILE 'REGISTRY' - CONTINUE? (Y)/N:y

'HISTR' IS NOT A VALID FORMAT FOR FILE 'REGISTRY'

The following are valid formats:

Substance information can be displayed by requesting individual fields or predefined formats. The predefined substance formats are: (RN = CAS Registry Number)

REG - RN
SAM - Index Name, MF, and structure - no RN
FIDE - All substance data, except sequence data
IDE - FIDE, but only 50 names
SQIDE - IDE, plus sequence data
SQIDE3 - Same as SQIDE, but 3-letter amino acid codes are used
SQD - Protein sequence data, includes RN
SQD3 - Same as SQD, but 3-letter amino acid codes are used
SQN - Protein sequence name information, includes RN

Any CA File format may be combined with any substance format to obtain CA references citing the substance. The substance formats must be cited first. The CA File predefined formats are:

ABS -- Abstract
APPS -- Application and Priority Information
BIB -- CA Accession Number, plus Bibliographic Data
CAN -- CA Accession Number
CBIB -- CA Accession Number, plus Bibliographic Data (compressed)
IND -- Index Data
IPC -- International Patent Classification
PATS -- PI, SO
STD -- BIB, IPC, and NCL

IABS --ABS, indented, with text labels
IBIB -- BIB, indented, with text labels
ISTD -- STD format, indented

OBIB ----- AN, plus Bibliographic Data (original)
OIBIB ----- OBIB, indented with text labels

SBIB ----- BIB, no citations
SIBIB ----- IBIB, no citations

The ALL format gives FIDE BIB ABS IND RE, plus sequence data when it is available.

The MAX format is the same as ALL.

The IALL format is the same as ALL with BIB ABS and IND indented, with text labels.

For additional information, please consult the following help messages:

HELP DFIELDS -- To see a complete list of individual display fields.

HELP FORMATS -- To see detailed descriptions of the predefined formats.

ENTER DISPLAY FORMAT (IDE):end

CN	1,3-Isobenzofurandione (9CI) (CA INDEX NAME)				

AB Phthalic anhydride is prepd. in high yield and selectivity by the **gas-phase catalytic oxidn.** of ortho-xylene and/or naphthalene with an oxygen-contg. gas using a fixed-bed reactor. The **gas-phase catalytic oxidn.** process is performed in .gtoreq.3 individual catalytic layers, and the conversion rates of ortho-xylene and/or naphthalene in the individual layers are controlled within specific ranges. This process produces phthalic anhydride in high yield, minimizes deterioration of catalysts with time, and enables the continuous, stable prodn. of phthalic anhydride even when a high concn. of material gas is fed into the reactor.

RN	85-44-9 CAPLUS				
CN	1,3-Isobenzofurandione (9CI) (CA INDEX NAME)				

AB Prodn. of gaseous products is carried out in a reactor by (1) preheating of a gas loaded with a charge to a starting temp. in a heating stage and (2) passing through several successive catalytic stages alternating with cooling zones. A resulting reaction gas is withdrawn from the reactor and passed through a desublimation or condensation stage. Preferably, the system is suitable for manuf. of phthalic anhydride from o-xylene or naphthalene by **catalytic oxidn.** in preheated compressed air.

AB The V-Ti coated catalysts for the prodn. of phthalic anhydride in a two-stage fixed bed reactor through **gas-phase catalytic oxidn.** of o-xylene by mol. oxygen and the influence of main active ingredients (TiO₂) and co-catalysts (the oxides of Ag, Zn, P, Sb and Rb) on properties of catalysts were studied. The results obtained from bench scale single-tube reactor show that the catalysts have good activity and high selectivity. At a space velocity of 3000 h⁻¹ and an o-xylene concn. of 80 g/m³, a conversion of 100%, phthalic anhydride yield >108% and Ph phthalein content in crude phthalic anhydride of less than 0.04% were obtained. Continued operations using the catalysts proved that the catalysts have good stability and repeatability.

AB A catalyst is claimed for the **catalytic oxidn.**, for example for the prepn. of acid anhydrides and nitrile from a hydrocarbon and the process for the manuf. of an acid anhydride and a nitrile using the catalyst. For the catalyst prepn. a carrier contg. Si carbide, inorg. binding component, and at least one oxide selected from the group consisting of a Nb oxide, an Sb oxide, and a W oxide was used for the support of at least one oxide selected from the group consisting of a V oxide and a Mo oxide as catalytically active component. For example, a carrier consisting of SiC, SiO₂, mullite and Nb₂O₅ in a wt. ratio of 90:5:5:1 and contg. < 0.2 % alkali metal and alk. earth metal was prepd. by baking at 1300.degree.. Aq. Ti(SO₄)₂ was obtained from ilmenite and H₂SO₄ and reacted with steam to give TiO₂. The TiO₂ (active catalyst component) was added to an aq. oxalic acid soln. contg. NH₄VO₃, NH₄H₂PO₄, NbCl₅, Cs₂SO₄ and Sb₂O₃, baked and the resulting slurry was sprayed onto the carrier. This catalyst was used in the **gas-phase** oxidn. of o-xylene, producing phthalic anhydride in .apprx. 100.simeq. yield.

AB A total of 29 assocd. components were identified in tech.
 9,10-anthraquinone. The product contained all the prominent impurities
 present in the starting anthracene except for 9,10-dihydroanthracene and
 fluorene. 9-(9-Anthryl)carbazole and Diels-Alder type adducts of
 anthracene with maleic anhydride and with maleimide were also detected.
 The isolated and identified by-products of oxidn. of anthracene were
 1,4-anthraquinone, 4,4'-dioxo-1,1'-bianthrylidene, 4,10'-dioxo-1,9'-
 bianthrylidene, 1-(4-oxy-1-naphthylidene)-4-oxyanthracene,
 2,3-naphthalenedicarboxylic acid and anhydride, and 5,7,12,14-tetrahydro-
 5,14;7,12-di(o-benzo)pentacene-6,13-dione. Dibenzo[b,d]pyrone,
 xanthone, 1,8-naphthalenedicarboxylic anhydride, 9-fluorenone, and
 naphtho[2,3-b]thiophene-4,9-dione were isolated and identified as oxidn.
 products of anthracene impurities. Phthalic anhydride, phthalimide,
 maleic anhydride, maleimide, phthalic acid, and maleic acid were found as
 products of deeper oxidn. of the starting materials. Four addnl.
 components whose structure could not be detd. were also isolated. The
 pathway of the anthracene oxidn. is suggested.

(manuf. of, by oxidn. of naphthalene with air with irradiation by .gamma.-rays)

RN 85-44-9 CAPLUS

CN 1,3-Isobenzofurandione (9CI) (CA INDEX NAME)

AB In a process for the manuf. of phthalic anhydride by **catalytic oxidn.** of crude naphthalene with air in the **gas phase** over liquid or solid contacts with irradiation with high-energy electromagnetic waves, the gaseous reactants naphthalene and O are irradiated with .gamma.-rays of .gtoreq.1 Mev. generated by synthetic radioactive elements, e.g. by ⁶⁰Co, before entering the reaction chamber. The thus excited and ionized reactants are passed over a catalyst consisting of V2O5, and optionally the oxides of W, Mo, and Sn, suspended on a ceramic carrier which has been annealed at 1200.degree.. Preferably .gamma.-ray sources with 500,000-800,000 r./hr. are used. A preferred catalyst consists of carrier globules of 4-5 mm. diam. contg. Al2O3 26.1, TiO2 2.1, Fe2O3 1.1, alk. earth metals 1.4%, the active component consisting of V2O5 8, MoO3 0.4, WO3 0.4, and SnO2 0.4%, calcd. on the wt. of the final catalyst. An app. for conducting the process is described, consisting of a tubular furnace in which the radioactive source is arranged in the middle axis of the inlet for the gaseous reactants.

AB Phthalic anhydride can be produced by **gas phase oxidn.** of benzocyclobutene (I) over a V2O5 catalyst. The catalyst carrier is corindon. I reacts with O in air yielding phthalan (II) as the first reaction product. II is oxidized partially to phthalide (III) and to o-phthalic dialdehyde (IV). Both III and IV undergo oxidn. to give phthalic anhydride (V). There is evidence that phthalan is formed by

direct fast reaction of O with the diene form of I. IV can be obtained in substantial amts. operating at low temp. Probable reaction mechanisms are analyzed. Highest conversion appears to occur with 0.07-sec. residence time at 460.degree. and 180 mole of air per mole I in feed. Conversion is 84.4% and the product contains 68.8 weight % of V.
